

## EXERCISE-16

### PROCEDURES AND FUNCTIONS

#### PROCEDURES

##### DEFINITION

A procedure or function is a logically grouped set of SQL and PL/SQL statements that perform a specific task. They are essentially sub-programs. Procedures and functions are made up of,

- Declarative part
- Executable part
- Optional exception handling part

These procedures and functions do not show the errors.

#### KEYWORDS AND THEIR PURPOSES

**REPLACE:** It recreates the procedure if it already exists.

**PROCEDURE:** It is the name of the procedure to be created.

**ARGUMENT:** It is the name of the argument to the procedure. Paranthesis can be omitted if no arguments are present.

**IN:** Specifies that a value for the argument must be specified when calling the procedure ie. used to pass values to a sub-program. This is the default parameter.

**OUT:** Specifies that the procedure passes a value for this argument back to it's calling environment after execution ie. used to return values to a caller of the sub-program.

**INOUT:** Specifies that a value for the argument must be specified when calling the procedure and that procedure passes a value for this argument back to it's calling environment after execution.

**RETURN:** It is the datatype of the function's return value because every function must return a value, this clause is required.

#### PROCEDURES – SYNTAX

```
create or replace procedure <procedure name> (argument {in,out,inout} datatype ) {is,as}
variable declaration;
constant declaration;
begin
PL/SQL subprogram body;
exception
exception PL/SQL block;
end;
```

#### FUNCTIONS – SYNTAX

```
create or replace function <function name> (argument in datatype,.....) return datatype {is,as}
variable declaration;
```

### Program 1

#### FACTORIAL OF A NUMBER USING FUNCTION

CREATE or define function

get\_factorial (P-num :> NUMBER);  
RETURN NUMBER

DISPLAY function  
(factorial is 0;  
in result);

ES

V-fact NUMBER := 1;

END;

BEGIN;

IF P-num > 0 THEN

RETURN V;

ELSE IF P-num = 0 THEN

RETURN;

ELSE

FOR i:=1...P-num DO

V := V \* i;

END DO;

RETURN V;

END IF;

END;

END IF STATEMENTS

DISPLAY

V - RESULT > NUMBER;

END;

V - result; get\_factorial

Program 2

Write a PL/SQL program using Procedures IN,INOUT,OUT parameters to retrieve the corresponding book information in library

CREATE or replace procedure  
manage\_book\_info(  
    IN book\_id IN NUMBER,  
    IN book\_name IN Varchar,  
    IN book\_type IN Varchar,  
    IN author\_name IN Varchar,  
    IN no\_of\_copies IN NUMBER,  
    OUT available\_copies OUT NUMBER);  
BEGIN  
    SELECT book\_id, book\_name, book\_type,  
        author\_name, no\_of\_copies,  
        available\_copies  
    INTO book\_id, book\_name, book\_type,  
        author\_name, no\_of\_copies,  
        available\_copies  
    FROM library\_books  
    WHERE book\_id = :book\_id;  
    available\_copies := no\_of\_copies - 1;  
END;

LS  
V. author\_name varcha  
IN book\_id NUMBER  
IN book\_name Varchar  
IN book\_type Varchar  
IN author\_name Varchar  
IN no\_of\_copies NUMBER  
OUT available\_copies NUMBER  
BEGIN  
    SELECT book\_id, book\_name, book\_type,  
        author\_name, no\_of\_copies,  
        available\_copies  
    INTO book\_id, book\_name, book\_type,  
        author\_name, no\_of\_copies,  
        available\_copies  
    FROM library\_books  
    WHERE book\_id = :book\_id;  
    available\_copies := no\_of\_copies - 1;  
END;
